## PRACTICAL-2

### AIM: GTU PROGRAMS:

1)Write console based program in code behind language VB or C# to print following pattern.

```
@ @ @ @ @
@ @ @ @
@ @ @
@ @
@
```

```
using System;
namespace Pattern
{
    class PatternExample
    {
        public static void Main()
        {
            int i,j=5;
            for (; j > 0; j--)
            {
                for (i = j; i > 0; i--)
                    Console.Write("@ ");
                Console.WriteLine();
            }
        }
    }
}
```

2)Write console based program in code behind language VB or C# to print following pattern.

```
1
1 2
1 2 3
1 2 3 4
```

```
using System;
namespace Pattern
{
```

```

class patternExample
{
    public static void Main()
    {
        int i, j;
        for (j = 1; j < 5; j++)
        {
            for (i = 1; i <= j; i++)
                Console.Write(i + " ");
            Console.WriteLine();
        }
    }
}

```

**3. Write C# code to prompt a user to input his/her name and country name and then the output will be shown as an example below:  
Hello Ram from country India.**

```

using System;
public class userdata
{
    public static void Main()
    {
        string name, country;
        Console.Write("Enter Your Name: ");
        name = Console.ReadLine();
        Console.Write("Enter Your Country: ");
        country = Console.ReadLine();
        Console.WriteLine("Hello " + name + " from country " +
            country);
    }
}

```

**Output:**

Enter your name:vvp

Enter your country:india

Hello vvp from country india

**4.Create C# console application to define Car class and derive Maruti and Mahindra from it to demonstrate inheritance.**

```
using System;
public class Car
{
    protected string name;
    public Car(string name)
    {
        this.name = name;
    }
    public Car()
    {
    }
    public virtual string Name
    {
        get
        {
            return name;
        }
        set
        {
            if(value.Length>3)
                name = value;
            else
                name="Unknown";
        }
    }
}
public class Maruti : Car
{
    public Maruti(string name) : base(name)
    {
    }
    public override string Name
    {
        get
        {
            return name;
        }
        set
        {
            if(value.Length>3)
                name = value + " -Maruti";
            else
```

```
        name="Unknown";
    }
}
public bool haveAGS;
}

public class Mahindra : Car
{
    public Mahindra(string name) : base(name)
    {
    }
    public Mahindra(){}
    public override string Name
    {
        get
        {
            return name;
        }
        set
        {
            if(value.Length>3)
                name = value + " -Mahindra";
            else
                name="Unknown";
        }
    }
}

public class Program
{
    public static void Main()
    {
        Maruti car1 = new Maruti("Swift");
        car1.haveAGS = true;
        car1.Name = "Swift";
        Console.WriteLine("Details Car 1: {0} and {1}",car1.Name,car1.haveAGS==true?"Have AGS":"not Have AGS");
        Mahindra car2 = new Mahindra();
        car2.Name = "XUV500";
        Console.WriteLine("Car 2: {0}",car2.Name);
    }
}
```

Output:

This is maruti class

This is Mahindra class...

## PRACTICAL-3

### AIM:OVERLOADING

Write a c# program to add two integers, two vectors and two metric using method overloading.

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;
namespace p3
{
    public class Add
    {
        public void add()
        {
            int[,] m1 = new int[20, 20];
            int[,] m2 = new int[20, 20];
            int[,] m3 = new int[20, 20];
            Console.WriteLine("enter size of array:");
            int size = Convert.ToInt32(Console.ReadLine());
            Console.WriteLine("enter first array:");
            for (inti = 0; i < size; i++)
            {
                for (int j = 0; j < size; j++)
                {
                    m1[i, j] =
                        Convert.ToInt32(Console.ReadLine())
                }
            }
            Console.WriteLine("enter second array:");
            for (inti = 0; i < size; i++)
            {
                for (int j = 0; j < size; j++)
                {
                    m2[i, j] =
                        Convert.ToInt32(Console.ReadLine());
                }
            }
        }
    }
}
```

```

    }
    for (inti = 0; i < size; i++)
    {
        for (int j = 0; j < size; j++)
        {
            m3[i, j] = m1[i, j] + m2[i, j];
        }
    }

    Console.WriteLine("addition array:");
    for (inti = 0; i < size; i++)
    {
        Console.WriteLine("\n");
        for (int j = 0; j < size; j++)
        {
            Console.WriteLine("{0}\t", m3[i, j]);
        }
        Console.WriteLine("\n");
    }
}

public int add(int a, int b)
{
    return (a + b);
}

}

public class Vector
{
    public void add()
    {
        Console.WriteLine("enter first vector");
        int x = Convert.ToInt32(Console.ReadLine());
        int y = Convert.ToInt32(Console.ReadLine());
        int z = Convert.ToInt32(Console.ReadLine());
        Console.WriteLine("enter second vector");
        int x1 = Convert.ToInt32(Console.ReadLine());
        int y1 = Convert.ToInt32(Console.ReadLine());
        int z1 = Convert.ToInt32(Console.ReadLine());
        int x2 = x + x1;
    }
}

```

```
        int y2 = y + y1;
        int z2 = z + z1;
        Console.WriteLine("<" + x2 + "," + y2 + "," + z2 +
            ">");
    }
}

class Program
{
    static void Main(string[] args)
    {
        Add a1 = new Add();
        Vector v1 = new Vector();
        v1.add();
        a1.add();
        int res=a1.add(1, 2);
        Console.Write("method overloading for
            addtion{0}",res);
        Console.ReadLine();
    }
}
```

Enter Number 1:

1

Enter Number 2:

2

Addition of Number:3

Enter Vector 1:

1

Addition of vector: x=4, y=3

Addition of two metrics:

Addition: 6

Addition: 8

Addition: 10

Addition: 12

**Write a c# program that create student object. Overload constror to create new instant with following details.**

- 1. Name**
- 2. Name, Enrollment**
- 3. Name, Enrollment, Branch**

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;
using System.Reflection;
namespace p3a1
{
    class Program
    {
        public int ID
        {
            get; set;
        }
    }
}
```

```

    public string Name
    {
        get; set;
    }
    String name, branch;
    public Program(String name)
    {
        this.name = name;
        Console.WriteLine("constructor 1:" + name);
    }
    public Program(String name, intenrol)
    {
        this.name = name;
        this.enrol = enrol;
        Console.WriteLine("constructor 2:" + name + " " + enrol);
    }
    public Program(String name, intenrol, String branch)
    {
        this.name = name;
        this.enrol = enrol;
        this.branch = branch;
        Console.WriteLine("constructor 3:" + name + " " + enrol + "
" + branch);
    }
    static void Main(string[] args)
    {
        Program p1 = new Program("bob");
        Program p2 = new Program("bob", 1);
        Program p3 = new Program("bob", 1, "computer");
        Console.ReadLine();
    }
}
First Constructor initiated..
Second Constructor initiated..

Third Constructor initiated..

```

## PRACTICAL-4

### AIM: REFLECTION

Create a c# program to find Methods, Properties and Constructors from class of running program.(Use Class from previous practical)

```
using System;
using System.Reflection;
namespace ReflectionExample
{
    class MainClass
    {
        static void Main()
        {
            Type T = Type.GetType("ReflectionExample.Customer");
            MethodInfo[] methods = T.GetMethods();
            foreach (MethodInfo method in methods)
            {
                Console.WriteLine(method.ReturnType + " " +
method.Name);
            }

            PropertyInfo[] properties = T.GetProperties();

            Console.WriteLine("\nProperties");
            foreach (PropertyInfo property in properties)
            {
                Console.WriteLine(property.PropertyType+" "+
property.Name);
            }

            Console.WriteLine("\nConstructors");
            ConstructorInfo[] constructors = T.GetConstructors();
            foreach (ConstructorInfo constructor in constructors)
            {
                Console.WriteLine(constructor.ToString());
            }
        }
    }
}
```

```
}
class Customer
{
    public int ID { get; set; }
    public string Name { get; set; }
    public Customer(int ID, string Name)
    {
        this.ID = ID;
        this.Name = Name;
    }
    public Customer()
    {
        this.ID = -1;
        this.Name = string.Empty;
    }
    public void printID()
    {
        Console.WriteLine("ID is: {0}", this.ID);
    }
    public void printName()
    {
        Console.WriteLine("Name is: {0}", this.Name);
    }
}
}
```

Output:

System.Int32 get\_ID

System.Void set\_ID

System.String get\_Name

System.Void set\_Name

System.Void printID

System.Void printName

System.String ToString

System.Boolean Equals

System.Int32 GetHashCode

System.Type GetType

Properties

System.Int32 ID

System.String Name

Constructors

Void .ctor(Int32, System.String)

Void .ctor()

## PRACTICAL-5

### AIM:FILE HANDLING

1. Write a C# program to copy data from one file to another using StreamReader and StreamWriter class.

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;
using System.IO;

namespace PRACTICAL_5
{
    class Program
    {
        static void Main(string[] args)
        {
            CopyFile cp = new CopyFile();
            String file1 = @"D:\DOTNET\PRACTICAL_5\file1.txt";
            String file2 = @"D:\DOTNET\PRACTICAL_5\file2.txt";
            cp.copyFile(file1, file2);
        }
    }
    public class CopyFile
    {
        public void copyFile(String file1, String file2)
        {
            using (StreamReader reader = new StreamReader(file1))
            {
                using (StreamWriter writer = new StreamWriter(file2))
                {
                    String line = null;
                    while ((line = reader.ReadLine()) != null)
                    {
                        writer.WriteLine(line);
                    }
                }
            }
        }
    }
}
```

```

    }
    }
    }
    }
    }
}

```

Output:

F1.txt: Hello World...

F2.txt: Hello World...

## 2. Write a C# Program to Read Lines from a File until the End of File is Reached.

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;
using System.IO;

namespace PRACTICAL_5
{
    class Readfile
    {
        static void Main()
        {
            StreamReader reader = new
StreamReader(@"D:\DOTNET\PRACTICAL_5\file1.txt");
            using (reader)
            {
                int lineNumber = 0;
                String line = reader.ReadLine();
                while (line != null)
                {
                    lineNumber++;
                    Console.WriteLine("Line {0}:{1}", lineNumber,
line);
                }
            }
        }
    }
}

```

```
        line = reader.ReadLine();  
    }  
    Console.ReadLine();  
}  
}  
}  
}
```

F1.txt:

Hello World.....

hii

how

are you

???

F2.txt:

Hello World.....

hii

how

are you

???

**3. Write a C# Program to List Files in a Directory.**

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;
using System.IO;

namespace PRACTICAL_5
{
    class Listdir
    {
        static void Main(string[] args)
        {
            string[] Directories =
Directory.GetDirectories(@"D:\DOTNET\PRACTICAL_5");
            Console.WriteLine("All the Directories are:");
            foreach (string dir in Directories)
            {
                //Console.WriteLine("All the Directories are:");
                Console.WriteLine(dir);
            }
            string[] files =
Directory.GetFiles(@"D:\DOTNET\PRACTICAL_5");
            Console.WriteLine("All the Files are:");
            foreach (string file in files)
            {
                // Console.WriteLine("All the Files are:");
                Console.WriteLine(file);
            }
            Console.ReadLine();
        }
    }
}
```

**Output:**

E:\SEM-6 .NET\VS\P1-master

E:\SEM-6 .NET\VS\p2

E:\SEM-6 .NET\VS\Assignment.docx

E:\SEM-6 .NET\VS\C# word.txt

E:\SEM-6 .NET\VS\~\$VS.docx

## PRACTICAL-6

### AIM:WINDOWS FORM APPLICATION

**Create Windows Form Application for Student Registration and store student Details in Database.**

**Form.cs:**

```
using System;

using System.Collections.Generic;

using System.ComponentModel;
using System.Data;

using System.Drawing;
using System.Linq;

using System.Text;

using System.Windows.Forms;
using System.Data.SqlClient;

using System.IO;

namespace StudentForm
{
    public partial class Form1 : Form
    {

```

```
string imgPath;

public Form1()
{
    InitializeComponent();
}

private void btnsave_Click(object sender, EventArgs e)
{
    string gen = null;

    string subject = null;
    if (genMale.Checked == true) {
        gen = "m";
    }
    if (genFemale.Checked == true) {
        gen = "f";
    }

    if (ck1.Checked == true) {
        subject = subject + " s1";
    }

    if (ck2.Checked == true) {
        subject = subject + " s2";
    }
}
```

```
string source = @"Data Source=Akash-
Patel\SQLExpress;Initial Catalog=DemoDb;Integrated
Security=True;Pooling=False";

string insert = "insert into tblstudent
(fname,lname,gender,subject,imgStudent) values ('" +
txtfname.Text + "','" + txtlname.Text + "','" + gen + "','"
+ subject + "','" + (imgPath

== null ? "" : imgPath) +
"')";
//MessageBox.Show(insert)
;

//string insert = "insert into tblstudent(fname) values
('jhgj')"; SqlConnection conn = new
SqlConnection(source);

SqlCommand cmd = new
SqlCommand(insert,conn); conn.Open();

int i = cmd.ExecuteNonQuery();

conn.Close();

Console.WriteLine("Success....");

}

private void Form1_Load(object sender, EventArgs e)

{

}
```

```
private void btnimg_Click(object sender, EventArgs e)

{
    openFileDialog1.Filter = "Jpg|*.jpg";

    if (openFileDialog1.ShowDialog() == DialogResult.OK)
    {
        imgPath = openFileDialog1.SafeFileName;

        pictureBox.Image =
        Image.FromFile(openFileDialog1.FileName);
        //MessageBox.Show(imgPath);
    }
}

}
```

**Program.cs:**

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Windows.Forms;
namespace StudentForm
{
    static void Main()
    {
        Application.EnableVisualStyles();
```

```
Application.SetCompatibleTextRenderingDefault(false);  
Application.Run(new Form1());  
}  
  
}  
  
}
```

The screenshot displays a Windows Form application with a light gray background. On the left side, there is a registration form with the following controls:

- First Name:** A text box containing the text "ABC".
- Last Name:** A text box containing the text "AAA".
- Gender:** A group box containing two radio buttons: "Male" (unselected) and "Female" (selected).
- subject:** A group box containing two checkboxes: "s1" (checked) and "s2" (unchecked).
- Save:** A button with a blue border and the text "Save".

On the right side of the form, there is a placeholder for a profile picture, represented by a square box with a blurred image. Below the picture placeholder is an "Upload" button.
